

Examples of fire hazards in cable trays

Overview

Overloaded cables, poor ventilation, and damaged insulation can lead to overheating and fire hazards. Wires snake through cable trays overhead. What happens if they catch fire?

How do you stop it?

Let's break down a real Cable Tray Fire Incident and share actionable fixes. Flames tore through 24m². If not designed and installed properly, wiring inside cable trays may pose hazards such as fire, electric shock, and arc-flash blast events. Cable trays can be part of a planned cable management system to support, route, protect, and provide a pathway for cable systems. Poorly fitted trays may serve as a fuse in case of a short or a top chimney in case of a fire. Commercial buildings, Power plants, large data centers and industrial facilities carry hundreds of kilometers of cable. When PVC-insulated cables burn they release hydrochloric acid — not just fire, but corrosive smoke that destroys equipment.
