

Fire alarm control distribution box power failure

Overview

Power-related issues are among the most critical faults in fire alarm control panels. Every commercial fire alarm panel is required to maintain both primary (AC mains) and secondary (battery) power sources. When the panel detects voltage irregularities, it generates a power supply trouble signal. Diagnosing power supply troubles is not always straightforward, as these issues can manifest in various conditions displayed at the panel. Some problems are clear-cut, such as an illuminated “Battery Trouble” LED or the absence of a green “AC On” light. But what should you do if there is a fault in the fire alarm. When a fire alarm panel system trouble signal activates, it indicates that a non-fire fault condition exists within the fire alarm system, signaling that a component or circuit isn't functioning as intended and requires investigation and repair to maintain full operational readiness.
