

Fusion Technology of Optical Splitter Taper

Overview

At its core, an FBT splitter operates on the principle of fused biconical tapering, a process where two or more optical fibers are fused together and stretched under controlled heat, creating a tapered interaction region that couples light evanescently between the cores. Over the years, FBT machine technology has evolved significantly, improving the precision, stability, and efficiency of. In the ever-evolving landscape of optical communication, the Fiber FBT Machine (Fused Biconical Taper) has emerged as a cornerstone technology for manufacturing high-performance optical components. It is not only low in cost, but also supports different energy-wind-solar ratios. At the same time, FBT SPLITTER COUPLER can be used in modular monitoring terminals and can play an excellent role in EDFA modules.
