

Grounding of the electrical distribution box in the steel structure workshop

Overview

Single-point grounding is the preferred method because it generally yields the lowest potential difference in the work zone and because it usually requires less grounding equipment and effort to install. For those involved in designing and erecting steel structures, understanding the intricate dance of electrical systems is crucial. Due to the high hardness of stainless steel, drilling holes later is not only laborious but also easily damages the anti-corrosion layer. Simple as it is and defined a long time ago by IEEE. The protective grounding system, which includes conductor grounds and worker bonding, must be engineered to protect workers from hazardous voltages that can be created by line reenergizing, lightning, or induced oltage.
