

How to connect a 4-core cable to the distribution box

AI Overview

A 4-core cable is connected to a distribution box by matching each conductor to its corresponding terminal—three live phases and one neutral—while ensuring proper grounding and adherence to color codes. Understanding the 4-Core Cable

A 4-core cable contains four insulated conductors within a single sheath. In modern three-phase systems, the typical color coding is:

- Brown (L1): First live phase
- Black (L2): Second live phase
- Grey (L3): Third live phase
- Blue (N): Neutral return path

Older systems may use different colors, so always verify the standard in your region before connecting.

Steps to Connect the Cable

- Turn Off Power:** Ensure the main supply is switched off to prevent electric shock.
- Prepare the Cable:** Remove the outer sheath carefully and strip the insulation from each conductor according to the manufacturer's guidelines.
- Connect Live Wires:** Attach the brown, black, and grey wires to the corresponding phase terminals in the distribution box. Use a phase rotation tester if necessary to confirm the correct sequence.
- Connect Neutral Wire:** Connect the blue wire to the neutral bus bar in the distribution box.
- Grounding:** If the cable does not include a dedicated earth wire, run an external green/yellow earth wire to the ground bus bar for safety.
- Secure the Wires:** Use plastic ties to bind the wires neatly, ensuring they are straight and evenly spaced.
- Labeling:** Clearly mark the AC, DC, or voltage levels for each circuit in the distribution box.
- Safety Inspection:** After wiring, perform a thorough inspection to check for loose connections, short circuits, or overload risks.

Additional Tips

- Always follow local electrical codes and manufacturer instructions.
- For single-phase applications, only one live wire may be used, with the remaining cores serving as neutral or control lines.
- If unsure about three-phase connections, consult a qualified electrician, as incorrect wiring can be h...
