

How to wire the power strip inside the distribution box

AI Overview

To wire a power strip in a distribution box, connect the phase, neutral, and earth wires from the distribution board to the power strip via appropriate MCBs and protective devices, ensuring safety and proper load distribution.

Step-by-Step Wiring Procedure

1. Turn Off Main Power: Before starting, ensure the main supply to the distribution box is turned off to prevent electric shock.
2. Identify Components in the Distribution Box: A typical single-phase distribution box includes a Main MCB, RCCB, single-pole or double-pole MCBs, a neutral link, and an earth link ().
3. Connect the Main Supply: Connect the phase and neutral wires from the energy meter to the main isolator or main MCB. From the main MCB, connect the output to the RCCB for leakage protection ().
4. Connect Load MCBs: For the power strip, use a single-pole MCB if it is a standard load. Connect the phase wire from the RCCB output to the input of the MCB. Connect the neutral wire from the RCCB output to the neutral link. Connect the earth wire from the power strip to the earth link ().
5. Connect the Power Strip: From the output terminals of the MCB, connect the phase wire to the power strip's live input. Connect the neutral wire from the neutral link to the power strip's neutral input. Connect the earth wire from the earth link to the power strip's earth terminal ().
6. Verify Wire Sizes and Ratings: Ensure the wire gauge matches the load of the power strip. The MCB rating should be appropriate for the total load connected to the power strip to prevent overcurrent ().
7. Test the Connections: After wiring, turn on the main supply and test the power strip. Check that the MCB trips correctly under overload and that the RCCB provides leakage protection ().
8. Safety Precautions: Always use insulated tools and wear protective gear. Ensure proper earthing to prevent electric shock. Avoid overloading the power strip beyond its rate...
