

Italian DML optical receiver debugging

Overview

The firmware is compiled and debugged under the IAR IDE environment. The invention discloses an optical module debugging system, which comprises a debugging board, a debugging communication mainboard and a debugging host machine, wherein the debugging board comprises a differential crystal oscillator which is used for providing data electric signals for a debugged. The use of directly modulated lasers (DMLs) is attractive in low-power, cost-constrained short-reach optical links. However, their limited modulation bandwidth can induce waveform distortion, undermining their data throughput. Traditional distortion mitigation techniques have relied mainly on the. TI 10G optical module SFP+ total solution is a complete demonstrated-working optical transceiver solution targeted for the small form factor pluggable (SFP+).
