

Low-loss solutions for Ukraine's energy management system

Overview

This involves replacing outdated thermal coal power plants with modern biofuel or waste-to-energy facilities, solar and wind power, integration of energy storage, and deployment of other innovative flexible generation technologies. More than ever, Ukraine needs support to transition towards a long-term energy system that is resilient, flexible and secure. The EU has the expertise, the ability and the will to help make that happen. Ukraine's energy systems have suffered significant damage since the full-scale invasion of 2022. Neither the United States Government nor any agency, nor any of their employees, makes any warranty, express or implied. This report highlights key lessons learned from Ukraine in the context of Russian attacks on Ukrainian energy infrastructure following the full-scale invasion in 2022.
