

Relay protection current over-limit alarm

Overview

Over current relay is a protection device which detects fault and provides a tripping signal to the circuit breaker. used in HT panel and substation as a protection relay. Plug Setting Multiplier (PSM) indicates how many times the determined relay secondary current (typically the CT secondary) exceeds the relay pickup (plug) current. It is the key quantity utilized in IDMT. The primary purpose of each is completely different. They are together in the catalog simply to highlight the fact that they are not PID controllers. The primary purpose of a limit controller is to act as part of a redundant control system that. Limit alarms accept analog inputs and provide low-limit, high-limit, or other discrete output indications based on the input value. Voltage or current input signals are compared to trip points configured via DIP switches or a programming module; relay outputs interface to other process equipment. The ANSI device number is 50 for an instantaneous overcurrent (IOC) or a Definite Time overcurrent (DTOC) and 51 for the Inverse Definite Minimum Time.
