

True Gigabit Fiber Optic Router

AI Overview

For true gigabit or multi-gig fiber internet, you need a router with at least a 2.5 Gbps WAN port, Wi-Fi 6E or Wi-Fi 7 support, and a powerful processor to handle multiple devices without bottlenecks.

Key Features to Look For

- WAN Port Speed:** A 1 Gbps WAN port limits your fiber connection to roughly 940 Mbps, even if your ISP provides faster speeds. For fiber plans above 1 Gbps, choose routers with 2.5 Gbps, 5 Gbps, or 10 Gbps WAN ports to fully utilize your bandwidth.
- Wi-Fi Standard:** Modern routers supporting Wi-Fi 6 (802.11ax), Wi-Fi 6E, or Wi-Fi 7 (802.11be) provide higher throughput, lower latency, and better performance in dense device environments. Wi-Fi 7 introduces Multi-Link Operation and 320 MHz channels, enabling multi-gig wireless speeds.
- Processor and RAM:** A quad-core CPU with at least 1 GB RAM ensures smooth handling of multiple devices, streaming, gaming, and video conferencing without bufferbloat or latency spikes.
- Port Aggregation and LAN Ports:** Routers with LAN port aggregation allow combining two or more ports for faster wired speeds. Multiple gigabit LAN ports are essential for connecting PCs, smart TVs, and gaming consoles.
- Coverage and Mesh Support:** Fiber routers often need to cover large homes. A single router can cover 2,500–3,500 sq. ft., but multi-story homes or thick walls may require mesh systems with dedicated backhaul channels to maintain multi-gig speeds.
