

# Two computer rooms share a power distribution box

## AI Overview

Two computer rooms can share a power distribution box, but careful planning is required to ensure load balancing, redundancy, and safety. Key Considerations

**Load Capacity and Distribution:** A single power distribution box (PDU or power distribution center) must be rated to handle the combined electrical load of both computer rooms. Overloading can lead to overheating, tripped breakers, or equipment failure. Advanced PDUs provide real-time monitoring and load balancing to prevent overloading and ensure even power distribution across all connected devices .

**Redundancy and Reliability:** Modern data centers often use A+B dual power feed architecture, where each critical load receives power from two independent sources. Sharing a single PDU between rooms can create a single point of failure unless redundancy is built in, such as using dual-input or hot-swap PDUs connected to separate UPS systems .

**PDU Types and Placement:** Floor-standing PDUs can supply multiple racks across rooms, while rack-mounted PDUs provide localized distribution within each rack. Combining both types allows efficient power delivery, better cable management, and easier monitoring . Surge protection and circuit breakers are essential to safeguard sensitive IT equipment .

**Electrical Room Requirements:** The shared PDU should be housed in a properly designed electrical room with reinforced floors, adequate ventilation, fire detection, and grounding systems. Access control and compliance with local electrical codes are critical for safety .

**Practical Implementation:** If two computer rooms share a PDU: Ensure the PDU is rated for the total load of both rooms. Use separate branch circuits or sub-PDUs for each room to isolate faults. Implement monitoring to track power usage and detect imbalances. Consider redundancy with dual inputs or backup PDUs to maintain upti...

Power Distribution Units (PDUs) are the crucial link between your facility's electrical infrastructure and your IT equipment. These devices ensure clean, stable power reaches every server, switch, and

What is a power distribution unit (PDU)?

A power distribution unit (PDU) is a device for controlling data center electrical power. The most basic PDUs are large power strips without surge protection. They are designed to provide

#### Power Supply Requirements for ICT rooms

Essential ICT rooms should receive their power supply from at least two separate main distribution systems (for example separate distribution systems for standby and uninterruptible power supplies).
